ABOUT ME

- : Computer Engineering graduate specializing in Artificial Intelligence, Machine Learning, and AI-driven software systems. Experienced in developing end-to-end solutions involving LLMs, RAG systems, voice assistants, and scalable backend architectures. Passionate about building intelligent technologies that solve real-world problems.

EDUCATION

- **Muğla Sıtkı Koçman University** Muğla, Turkey
BSc in Computer Engineering; GPA: 3.50 Sep. 2021 – Jun. 2026

TECHNICAL SKILLS

- **AI Systems & LLM Technologies:** Large Language Models, Retrieval Augmented Generation, AI Agents, Natural Language Processing, Vector Databases (Qdrant, FAISS), OpenSearch, Text-to-Speech, Speech-to-Text
- **Backend & Software Engineering:** Python, TypeScript, Java, NestJS, FastAPI, Flask, REST APIs, PostgreSQL, MySQL, Firebase, PrismaORM, Docker, Git/GitHub, Asterisk
- **Machine Learning & Data Science:** Machine Learning, Deep Learning, TensorFlow, Scikit-Learn, Pandas, NumPy, Data Preprocessing, Data Visualization (Matplotlib)
- **Application Development:** Flutter (Dart), Mobile and Desktop App Development, Object-Oriented Programming, Data Structures and Algorithms, End-to-end Development
- **Data Processing & Automation:** Web Scraping/Parsing, Selenium, BeautifulSoup, Regular Expressions, Data Collection and Automation

EXPERIENCE

- **Iceberg Digital** Essex, United Kingdom
Software Engineer Intern Jun 2026 – Present
 - **Responsibilities:** Developed a framework-agnostic video conferencing engine integrated into the company's CRM platform using Vanilla TypeScript and Zoom Video SDK. Designed a decoupled architecture with clear abstractions and independent testing capabilities to improve reliability, maintainability, and scalability. Prepared a Proof of Concept (PoC) analysis for Meta Business integrations, focusing on automation opportunities, workflow improvements, and compliance-aware advertising processes.
- **MAVA** Muğla, Turkey
Artificial Intelligence Intern Jun 2025 – Aug 2025
 - **Responsibilities:** Developed a recommendation system by scraping data from a dynamic e-commerce platform and leveraging product categories for predictive modeling. Experimented with multiple approaches, including Logistic Regression with TF-IDF, LSTM, GRU, and fine-tuned BERTurk. Trained the models and containerized both the models and the OpenSearch database using Docker, resolving dependency issues and ensuring scalability. Designed and implemented an innovative web interface using HTML/CSS, and built a chatbot service powered by Gemini API and Flask, seamlessly integrated into the interface.
- **Virtus R&D Software Inc.** Muğla, Turkey
Data Science Intern May 2024 – Oct 2024
 - **Responsibilities:** Developed Python scripts for data collection, preprocessing, and structuring, leveraging mathematical approaches to clean and organize CSV files. Worked on medical image processing using TensorFlow, focusing on deep learning-based analysis. Experienced in data mining, automation, and building efficient pipelines for data organization and analysis..

PROJECTS

- **BitSafe AI (TÜBİTAK 2209-A)**
 - Contributed to the AI components of a real-time, risk-based traffic analysis tool for small-scale networks, developed in Go using the BitNet model.
 - Implemented website classification based on the IAB Taxonomy to categorize network traffic and enhance risk assessment capabilities.
 - Additionally designed and deployed an efficient FastAPI service to serve the model for low-latency inference and scalable integration with the system.

• **Votel (Capstone Project)**

- Engineered an end-to-end hospitality platform designed to empower small and boutique hotels with enterprise level automation, drastically reducing their manual administrative overhead.
- At its core, I built a fully autonomous AI voice assistant utilizing Asterisk, Python, and FastAPI that seamlessly handles 100% of complex room reservations, cancellations, and customer inquiries over the phone without human intervention.
- This intelligent voice agent is directly integrated with a robust B2B management dashboard developed with Nest.js, PostgreSQL, and Flutter; allowing hotel staff to configure bot behavior and manage real-time room inventory effortlessly.
- To drive guest acquisition on the B2C side, the platform features a "Smart Hotel Finder" leveraging OpenSearch to deliver high-speed, natural language-based accommodation discovery tailored to user travel plans, while dynamically generating custom landing pages to establish online visibility for partner hotels lacking standalone websites.
- Finally, this highly scalable ecosystem is complemented by a cross-platform Flutter mobile application for on-the-go accessibility, with the entire architecture fully containerized via Docker for reliable deployment.

• **Layla - AI Based Mail Assistant**

- Developed a Flutter mobile app to manage Gmail accounts via Google OAuth2.
- Implemented features include full-text email search, a Gemini-powered chatbot, intelligent email header classification, and OCR-based document scanning.
- Demonstrates skills in mobile development, NLP, and API integration.

• **NeuroLoop**

- Developed a Flutter desktop app for educational use, featuring personalized Qdrant vector databases for each user.
- Implemented a Gemini-powered RAG system for natural language Q&A, and automated quiz generation with categorized question storage for efficient retrieval.

LANGUAGES

- : English — Professional working proficiency
- : Turkish — Native proficiency
